## 1.0 INTRODUCTION

This Data Summary Report (DSR) presents the results of groundwater sampling and analysis completed during the four quarterly events of 2023. These sampling events are part of the Parrot Monitoring Program (PMP), which is being conducted within the Butte Priority Soils Operable Unit (BPSOU) along Silver-Bow Creek in Butte, Montana.

This DSR was prepared for the Montana Natural Resource Damage Program (NRDP), by Water and Environmental Technologies (WET). Samples collected during the sampling events were shipped to Energy Laboratories in Helena, Montana for analysis. The data acquired as part of the investigation was gathered in accordance with the protocols outlined in the *Parrot Tailings Waste Removal Performance Monitoring Work Plan, Appendix C – Quality Assurance Project Plan (QAPP), NRDP 2017*. This DSR provides discussion on the following topics.

- Data Quality Objectives (DQOs).
- Measurement Quality Objectives and Metrics.
- Project Data Quality and Usability.
- Quarterly Monitoring Results.

### 1.1 Background

The majority of mine waste (tailings and slag) concentrated in the area surrounding the former Butte-Silver Bow (BSB) County Shops, resulted from mineral processing and refining operations associated with the Parrot Smelter. The approximate smelter location was centered within the footprint of the former baseball field, north of Civic Center Road. At its peak, the Parrot Smelter was processing ore at the rate of approximately 350 tons/day, producing 12.5 tons/day of copper, and discharging 110 tons/day of tailings. The Parrot Smelter also had a concentrating plant that treated second-class ore prior to smelting, which produced significant quantities of tailings. The Anaconda Mining Company (AMC) purchased the Parrot Smelter and closed the smelting operations in 1899. Between 1899 and 1904, AMC operated an acid precipitation plant at the site that leached copper from tailings and waste rock. During World War II, AMC reprocessed the tailings for copper through active leaching.

### 1.2 Purpose and Objectives

As part of the PMP planning, significant data gaps were identified. To fill these gaps and support comprehensive monitoring, the PMP incorporated existing monitoring wells, and installed new wells in areas where insufficient well densities were identified. The wells are grouped in transects throughout the project area and designed to establish baseline conditions prior to the removal of the Parrot Tailings (2018) and to evaluate remedy efficacy post excavation. Baseline data is compared to the subsequent performance monitoring following the tailings removal.

Specifically, the monitoring network was designed to characterize groundwater quality and flow conditions along five transects. **Figure 1** provides well locations along the linear transects developed to measure groundwater hydraulic and quality parameters as it moves down the Blacktail and Silver Bow Creek corridors. The transects are identified as A-A', B-B', C-C', D-D', and E-E'. The transects generally align perpendicular to both groundwater flow and the known or anticipated extent of groundwater impacts resulting from the Parrot Smelter. The PMP monitoring network currently consists of 66 groundwater samples and five surface water samples. Sampling locations are shown in **Figure 1**. Monitoring wells that were abandoned during the Phase 2 Excavation are also shown on **Figure 1**.

## 2.0 DATA AND MEASUREMENT QUALITY OBJECTIVES

The data quality objectives for the PMP are fully defined in the QAPP. The specific objectives for the monitoring program include the following:

- Install upgradient, source area, and downgradient monitoring points.
- Establish current/baseline conditions for the corridor prior to and following tailings removal efforts.
- Assess water levels and water quality throughout the impacted areas.
- Assess groundwater and surface gradients through the Butte Area One tailings.
- Develop accurate groundwater potentiometric surface maps.
- Establish hydraulic controls for three hydraulic features:
  - Blacktail Creek.
  - Silver-Bow Creek.
  - BPSOU Groundwater Collection.

### 2.1 Data Validation Summary

Results from groundwater and surface water samples collected during the four quarters of 2023 have undergone validation in accordance with the *EPA National Functional Guidelines for Inorganic Superfund Methods Data Review, November 2020* and the project-specific provisions outlined in the QAPP. The validation reports, compiled field forms, and laboratory analytical results for each quarterly event are included as attachments to this report. The following provides a discussion of the data quality for the four sampling events. **Table 1** provides the groundwater and surface water monthly and quarterly levels, as well as field parameters collected prior to sample collection at each well. **Table 2** provides the monthly and quarterly water levels collected during 2023. **Tables 3, 4, and 5** provide the analytical results and corresponding data qualifications. Finally, **Table 6**, provides the Relative Percent Differences between the parent samples and quality control (QC) duplicates.

### 2.1.1 First Quarter 2023 Summary

Sixty of the total 66 groundwater monitoring wells, four of five surface water sampling points, and three manholes into the sub-drain system underwent water level monitoring, sampling, and laboratory analysis as part of this event. Monitoring well AMW-01A was dry and was not sampled. Monitoring wells AMW-20 and PT14-1 were inaccessible due to poor road conditions and were not sampled. The flush mount lids on monitoring wells PMP-02A and PMP-02B were frozen and they could not be sampled. Monitoring well PMP-10B had a frozen water column and was unable to be sampled. Surface water site PMP-12 was frozen over and could not be sampled. Five duplicates, five equipment blanks, and five field blanks were also collected as Quality Assurance and Quality Control (QAQC) samples.

The samples were analyzed in accordance with the suite of analytes outlined in the *Parrot Tailings Waste Removal Performance Monitoring Work Plan, Appendix C – Quality Assurance Project Plan (QAPP), NRDP 2017*, resulting in a total of 4,768 individual data points. Of this total, 156 data points (3.27%) were qualified due to problems meeting the prescribed quality control objectives and are considered screening quality under the *Clark Fork Data Management/Data Validation Plan*. The remaining 4,612 (96.73%) of the data points are considered enforcement quality with no restrictions or qualifications. No data points were rejected; therefore, all values can be used to support decision-making.

**Attachment A** provides a detailed summary of the individual laboratory reports and the associated validation.

### 2.1.2 Second Quarter 2023 Summary

All 66 groundwater monitoring wells, all five surface water sampling points, and three manholes into the sub-drain system underwent water level monitoring, sampling, and laboratory analysis as part of this event. Five duplicates, three equipment blanks, and five field blanks were also collected as QAQC samples.

The samples were analyzed in accordance with the suite of analytes outlined in the QAPP, resulting in a total of 5,052 individual data points. Of this total, 179 data points (3.54%) were qualified due to problems meeting the prescribed quality control objectives and are considered screening quality under the *Clark Fork Data Management/Data Validation Plan*. The remaining 4,873 (96.46%) of the data points are considered enforcement quality with no restrictions or qualifications. No data points were rejected; therefore, all values can be used to support decision-making.

**Attachment B** provides a detailed summary of the individual laboratory reports and the associated data validation.

### 2.1.3 Third Quarter 2023 Summary

Sixty-five of the total 66 groundwater monitoring wells, all five surface water sampling points, and three manholes into the sub-drain system underwent water level monitoring, sampling, and laboratory analysis as part of this event. Monitoring well PT14-1 was inaccessible due to construction activities and was not sampled. The Survey123 field form for PMP-05BR was lost during the submittal process. Five duplicates, three equipment blanks, and five field blanks were also collected as QAQC samples.

The samples were analyzed in accordance with the suite of analytes outlined in the QAPP, resulting in a total of 4,996 individual data points. Of this total, 220 data points (4.40%) were qualified due to problems meeting the prescribed quality control objectives and are considered screening quality under the *Clark Fork Data Management/Data Validation Plan*. The remaining 4,776 (95.60%) of the data points are considered enforcement quality with no restrictions or qualifications. No data points were rejected; therefore, all values can be used to support decision-making.

**Attachment C** provides a detailed summary of the individual laboratory reports and associated validation.

### 2.1.4 Fourth Quarter 2023 Summary

All 66 groundwater monitoring wells, all five surface water sampling points, and three manholes into the sub-drain system underwent water level monitoring, sampling, and laboratory analysis as part of this event. Five duplicates, three equipment blanks, and five field blanks were also collected as QAQC samples.

The samples were analyzed in accordance with the suite of analytes outlined in the QAPP, resulting in a total of 5,054 individual data points. Of this total, 361 data points (7.14%) were qualified due to problems meeting the prescribed quality control objectives and are considered screening quality under the *Clark Fork Data Management/Data Validation Plan*. One data point was rejected; therefore, all values except carbonate in AMW-13B can be used to support decision-making. The remaining 4,692 (92.44%) of the data points are considered enforcement quality with no restrictions or qualifications.

**Attachment D** provides a detailed summary of the individual laboratory reports and the associated validation.

## 2.2 Overall Assessment

As part of the four quarters of groundwater monitoring summarized in this DSR, 276 groundwater samples, 19 surface water samples, and 12 sub-drain water samples were collected, or a total of 307 samples, resulting in 19,870 individual data points. Field quality control

included 20 field duplicates, 14 equipment blanks, and 20 field blanks. Of this total, 916 (4.61%) were qualified due to parameters outside of quality control objectives and are considered screening quality under the *Clark Fork Data Management/Data Validation Plan*. In addition, one data point was rejected (carbonate in AMW-13B during the fourth quarter) and is unusable. The remaining 18,953 data points (95.39%) are considered enforcement quality, exceeding the 90% goal set in the QAPP.

Assigned qualifications (J, J-, J+, U, or UJ) indicate some uncertainty in reported results due to accuracy and/or precision issues. One sample result was rejected during validation. The following provides a summary of assigned qualifications:

- Results qualified J: 399 (43.6% of qualified, 2.01% of total)
- Results qualified J-: 116 (12.7% of qualified, 0.58% of total)
- Results qualified J+: 266 (29.0% of qualified, 1.34% of total)
- Results qualified UJ: 135 (14.7% of qualified, 0.68% of total)
- Results qualified R: 1 (0.10% of qualified, <0.01% of total)

The attachments associated with each individual quarter provide further details regarding the type and quantity of qualifications given for each quarterly monitoring event. The noted qualifications, with the exception of the one rejected data point, do not limit the use of the results for purposes of decision-making in terms of risk assessment or remediation decisions, as noted in the *EPA Risk Assessment Guidance, Part A, Sec. 5.4.1, pg. 5-15 Data Usability* (EPA, 1989), which states the following with respect to use of ‘J’ or ‘UJ’ qualified results:

*"The guidance here is to use J-qualified concentrations the same way as positive data that do not have this qualifier. If possible, note potential uncertainties associated with the qualifier, so that if data qualified with a J contribute significantly to the risk, the appropriate caveats can be attached."*

## 2.3 Measurement Quality Objectives

Measurement quality objectives define the performance criteria for precision, accuracy, representativeness, comparability, and completeness for project data. The QAPP defines the acceptance criteria and performance indicators for all samples collected for the PMP project. A summary of the performance metrics for the PMP is provided below.

### 2.3.1 Precision

Precision is the measure of agreement between duplicate or replicate samples. The level of agreement between field and laboratory duplicates was measured as relative percent difference (RPD), as defined by the following equation:

---

$$\text{RPD} = \frac{\text{absolute value( initial measurement – duplicate measurement )}}{\text{Average of the two measurements}}$$

RPD calculations for all original and field duplicate samples are provided in **Table 6**. For the PMP, two types of duplicate/replicate measurements were collected, to support an examination of project precision: a) laboratory duplicates and b) blind field duplicates.

Field duplicates were submitted at a minimum frequency of 5% or one duplicate for every 20 natural samples collected, resulting in 20 blind duplicates from the four sampling events of 2023. The precision goal for field duplicates, as stated in the QAPP, is +/- 20% RPD for sample and duplicate results that are greater than five times the detection limit. In the case of a detected result paired with a non-detect result, the non-detect result is replaced with the half reporting limit value.

The first quarter exhibited six analyte RPD exceedances; however no qualification was required. The second quarter exhibited six analyte RPD exceedances, of which only one analyte required qualification, resulting in 10 estimated data points. The third quarter exhibited six analyte RPD exceedances, of which four analytes required qualification, resulting in 41 estimated data points. The fourth quarter exhibited six analyte RPD exceedances, of which two analytes required qualification, resulting in 40 estimated data points. The exceedances are provided in **Table 6**. Detailed descriptions of RPD exceedances can be found in the quarterly data summary reports included as **Attachments A through D**.

### 2.3.2 Accuracy

Accuracy is the measure of agreement between a laboratory measurement and a known or standard value. It is measured through a variety of QC samples that undergo analysis at the laboratory. Key indicators include:

- Calibration verification samples.
- Laboratory fortified blanks.
- Laboratory control samples.
- Matrix spike and matrix spike duplicates (MS/MSD).

Field QC samples also provide a measure of accuracy, specifically blind blanks and equipment blanks or rinsates. They provide a measure of any potential cross-contamination occurring during sampling and analysis and any bias introduced during the analytical process.

As noted in Section 2.2, 96.65% of the data acquired for the four quarterly events summarized herein met all accuracy criteria. This exceeds the 90% goal established in the QAPP. The qualified data included 3.33% of the data points and while qualified, they were not rejected and may also be used to evaluate site conditions. Finally, four individual data points (0.02%) were

---

rejected due to evaluation outside of the quality control limits. The full evaluation of accuracy is detailed in the individual data validation reports, included for each quarter in **Attachments A through D**.

### 2.3.3 Completeness

Completeness is the measure of the number of planned samples versus collected samples, planned analyses versus completed analyses, and valid data points acquired during a given sampling event versus the total number of data points acquired. All data collected for the four quarterly events of 2023 underwent data verification and validation in accordance with the *Clark Fork River Superfund Site Data Management / Data Validation Plan*. Out of 338 planned samples (284 natural, 54 QA/QC), 330 samples were collected (276 natural, 54 QA/QC), resulting in a 97.6% complete sampling events. Out of 3,300 analyses planned (330 samples multiplied by 10 methods), all 3,300 analyses were completed, resulting in 100% complete work orders. Out of 19,870 data points, only one data point was rejected, resulting in 99.99% valid and usable data for decision-making.

### 2.3.4 Representativeness

Representativeness is defined as the degree to which sample data represents the population being examined, in this case, the degree groundwater samples represent the full distribution of contaminants along the Blacktail and Silver Bow Creek corridors. The monitoring network relies on five monitoring well transects placed perpendicular to surface and groundwater flow (**Figure 1**). The transects were placed to allow for sampling at intervals along the creek corridor, which will support a full examination of water quality from Shields Avenue to Montana Street. The examination will also rely on historical groundwater and sediment data, which will be used to expand the performance monitoring window and allow for an examination of seasonal and temporal variations in surface and groundwater flow and quality. Water levels are being collected at over 80 locations to support the development of accurate potentiometric maps defining groundwater flow patterns. Field parameters and water levels are included in **Tables 1 and 2**.

### 2.3.5 Comparability

Comparability is the measure of confidence that can be assigned, when two data sets are compared or combined with one another. To evaluate comparability, the sampling techniques, laboratory methods, data distributions, and data quality must be considered for each data set, before a direct comparison or blending of data can be performed.

As noted, the PMP utilizes some existing groundwater and sediment data, to supplement the examination of baseline water quality, and future site conditions. Most of the historical data was generated by either Atlantic Richfield (ARCO) or the Montana Bureau of Mines and Geology (MBMG) programs. With few exceptions, historical data was acquired using industry-standard

sampling and analytical methods ranging from the collection of water levels, to well purging, and sampling techniques, and the laboratory methods employed to quantify constituent concentrations. These methods are comparable to the methods employed under the PMP. In most cases, the underlying data quality of these data sets has also been verified prior to its use in examining site conditions. As a result, the historical data can be blended with the PMP data, to provide a longer time period on which to base groundwater quality and flow trends.

Two areas where there are differences between historical and PMP data sets are: 1) differences in the constituents undergoing analysis and 2) the use of low flow purge/sampling methods for low-producing wells installed as part of the PMP. The majority of the constituents between data sets is generally comparable (major cations, metals of concern, etc.). However, the PMP is also monitoring some constituents (e.g., rare earth/trace metals) that have not undergone long-term analysis as part of ongoing monitoring. The new constituents will provide a much shorter time window in which to evaluate groundwater trends, because comparative historical data does not exist. The remainder of the constituents can be used as a blended data set when needed, to develop these trends.

Low flow sampling techniques are being employed for a subset of the wells installed under the PMP. These methods utilize similar protocols to higher volume well purge and sample techniques, in terms of monitoring for field parameter stabilization, prior to sampling, etc. The difference lies in the purge rate and equipment used. While there are differences in the methods, the goal of both methods is to evacuate stagnant water from the well column prior to collecting samples. Both methods introduce some error into the sampling regime, but both are accepted as industry-standard practices for well purging. As a result, unless specific biases are noted between the two data sets, the historical and PMP data should be acceptable for use when blended in evaluating long term groundwater trends at the site.

### 2.3.6 Data Quality / Data Usability

As the preceding discussions demonstrate, the surface and groundwater data acquired from the four 2023 PMP events satisfy all project quality goals. The results also meet the overriding DQOs by providing water level and analytical data that will support decision-making along the Silver Bow Creek corridor.

## 3.0 SAMPLING AND ANALYSIS SUMMARY

The QAPP defines the sampling and analysis objectives, policies, and procedures used to acquire data for the PMP. Level A/B review of the QAPP, field notes, and related sampling documentation reveals all the samples were collected, handled, and documented properly. Level A/B Reviews for each quarter are included in **Attachments A through D**.

### **Data Quality Executive Summary**

A total of 60 of the 66 total groundwater samples and four of the five surface water samples, as well as five field duplicates, five equipment blanks, and five field blanks were collected as part of Parrot Tailings Removal Performance Monitoring project. Monitoring wells AMW-01A, AMW-20, PT14-1, PMP-02A, PMP-02B, and PMP-10B, and surface water site PMP-12 were unable to be sampled. AMW-01A was dry, AMW-20 and PT14-1 were inaccessible due to road conditions, PMP-02A and PMP-02B flush mount lids were frozen over, PMP-10B water column was frozen, and PMP-12 was frozen over. A total of 4,768 individual data points were produced, and 100% of these data points may be used to support decision-making for the risk assessment, developing site-specific risk-based clean up goals, and support an evaluation of the scope of remedial action (if necessary).

Samples are submitted to Energy Laboratories in Helena, Montana. The Helena laboratory subs DOC and TOC analyses to the Energy Laboratories in Casper, Wyoming. DOC and TOC are collected in amber glass containers. Six containers were broken in transit from the Helena to

Casper laboratory. Out of 790 analyses planned (79 samples multiplied by 10 methods), 784 analyses (99.2%) were completed.

A total of 156 data points (3.27%) received qualification during validation due to results outside of QA/QC acceptance criteria, as defined in the *EPA National Functional Guidelines for Inorganic Data Review* (EPA, November 2020). These qualifications (J, J-, J+ , and UJ) indicate some uncertainty in reported results due to preservation, contamination, accuracy, and/or precision issues. The following provides a summary of qualified results suitable for use in further decision making regarding the NRD Parrot Tailings.

- Results qualified J: 79 (50.6% of qualified, 1.66% of total)
- Results qualified J-: 26 (16.7% of qualified, 0.55% of total)
- Results qualified J+: 43 (27.6% of qualified, 0.90% of total)
- Results qualified UJ: 8 (5.13% of qualified, 0.17% of total)

These qualifications, once assigned, do not limit the use of the results for purposes of decision making. The *EPA Risk Assessment Guidance, Part A, Sec. 5.4.1, pg. 5-15 Data Usability* (EPA, 1989) states the following with respect to use of 'J' or 'UJ' qualified results:

*"The guidance here is to use J-qualified concentrations the same way as positive data that do not have this qualifier. If possible, note potential uncertainties associated with the qualifier, so that if data qualified with a J contribute significantly to the risk, the appropriate caveats can be attached."*

Results qualified as R are not enforcement or screening quality and should not be used to inform decisions. Zero results were qualified as R.

### **QA/QC Review of Inorganic Data**

Data validation summaries were completed using the data validation guidelines from *EPA National Functional Guidelines for Inorganic Data Review* (EPA, November 2020). The completed summaries are attached. Laboratory data flags and qualifiers are listed in **Tables 3, 4, 5 and 6**.

### **Field Data Quality**

A total of 89 data points (1.87% of total) were qualified as estimated due to field QA/QC deficiencies. Of these qualifications, 79 data points (88.8% of qualified, 1.66% of total) were due to hold time exceedances, five data points (5.62% of qualified, 0.10% of total) were due to equipment rinse blank cross-contamination, and five data points (5.62% of qualified, 0.10% of total) were due to field blank contamination.

### **Preservation and Hold Times**

Preservation includes proper field filtration, preservation, and acceptable pH and temperature upon receipt by the laboratory. Hold time is determined from the date of collection to the date of

analysis. Laboratory pH hold time is 15 minutes, which is impossible to meet, so all analytical pH results were qualified as estimated; refer to field pH for accurate results. These accounted for all 79 qualified data points.

### Blanks

Equipment blank results are used to provide a measure of effectiveness of field decontamination procedures between sampling wells. Five equipment blank samples were collected during this sampling effort. Each equipment blank had detections for conductivity. Five data points (all field blank conductivity results) were qualified as estimated high (J+).

Field blank results are used to provide a measure of contamination during field sampling and sample processing. Five field blank samples were collected during this sampling effort. Each field blank had detections for conductivity. Five data points (all equipment blank conductivity results) were qualified as estimated high (J+).

### Duplicates

Field duplicate samples assess the variance of the field sampling methods. Duplicates were collected at a minimum frequency of 1 per 20 primary samples, meeting the project QAPP specified frequency, resulting in five field duplicate sample pairs. Six analytes exhibited relative percent differences (RPDs) above the 20% criteria, but none required qualification. A summary of the RPD results is provided in **Table 6**.

### **Laboratory Data Quality**

A total of 67 data points (1.41%) were qualified as estimated due to laboratory QA/QC deficiencies. Of these qualifications, one data point (1.49% of qualified, <0.01% of total) was due to field blank contamination and 66 data points (98.5% of qualified, 1.38% of total) were due to due to poor laboratory accuracy.

### Laboratory Blank Results

Laboratory method blanks assess contamination introduced during sample laboratory preparation activities. There were three manganese and two tin detections, resulting in only one data point (manganese in BPS11-14A) qualified as estimated high (J+).

### Laboratory Precision

Laboratory duplicate samples assess the variance of the analytical methods. All laboratory duplicate RPDs were below criteria maximums; therefore, no qualification was required.

### Accuracy

Laboratory accuracy is measured with percent recoveries for calibration verifications, laboratory fortified blanks or control samples, and matrix spikes. There were 14 matrix spike recovery failures, resulting in four bromide, seven calcium, 21 fluoride, 27 nitrate+nitrite, and seven sulfate data points qualified as estimated (J+, J-, or UJ).

**Completeness**

Out of 86 planned samples (71 natural, 15 QA/QC), 79 samples were collected (64 natural, 15 QA/QC), resulting in a 91.9% complete sample delivery group. Out of 790 analyses planned, 784 analyses were completed, resulting in 99.2% complete work orders. Out of 4,768 data points, all 4,768 data points are usable, resulting in a 100% complete data package. The project QAPP data quality objectives (DQOs) have been met.

QUALIFIER DEFINITIONS	
<b>U</b>	The analyte was analyzed for but was not detected above the level of the adjusted detection limit or quantitation limit, as appropriate.
<b>UJ</b>	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
<b>J</b>	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
<b>J-</b>	The result is an estimated quantity, but the result may be biased low.
<b>J+</b>	The result is an estimated quantity, but the result may be biased high.
<b>R</b>	The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

## OVERALL SUMMARY

### Data Quality

Out of 4768 total data points:

- 4612 data points (96.7%) remain unqualified and are considered quantitative.
- Out of 156 data points (3.3%) qualified as estimated and assigned as qualitative:
  - 89 data points (57.1% of qualified, 1.9% of total) were due to field QA/QC.
  - 67 data points (42.9% of qualified, 1.4% of total) were due to laboratory QA/QC.
- No data points were rejected.

### Completeness

Out of 86 samples planned (71 natural, 15 QA/QC), 79 (64 natural, 15 QA/QC) samples were completed. This SDG is 91.9% complete.

Out of 790 analyses planned, 784 analyses were completed. These WOs are 99.2% complete.

Out of 4768 data points produced, 4768 data points are useable. This data package is 100% complete.

### **Data Quality Executive Summary**

All 66 groundwater samples and all five surface water samples, as well as five field duplicates, three equipment blanks, and five field blanks were collected as part of Parrot Tailings Removal Performance Monitoring project. A total of 5,052 individual data points were produced, and 100% of these data points may be used to support decision-making for the risk assessment, developing site-specific risk-based clean up goals, and support an evaluation of the scope of remedial action (if necessary).

Samples are submitted to Energy Laboratories in Helena, Montana. The Helena laboratory subs DOC and TOC analyses to the Energy Laboratories in Casper, Wyoming. DOC and TOC are collected in amber glass containers. Two containers were broken in transit from the Helena to Casper laboratory. Out of 840 analyses planned (84 samples multiplied by 10 methods), 838 analyses (99.8%) were completed.

A total of 179 data points (3.54%) received qualification during validation due to results outside of QA/QC acceptance criteria, as defined in the *EPA National Functional Guidelines for*

*Inorganic Data Review* (EPA, November 2020). These qualifications (J, J-, J+ , and UJ) indicate some uncertainty in reported results due to preservation, contamination, accuracy, and/or precision issues. The following provides a summary of qualified results suitable for use in further decision making regarding the NRD Parrot Tailings.

- Results qualified J: 93 (52.0% of qualified, 1.84% of total)
- Results qualified J-: 13 (7.26% of qualified, 0.26% of total)
- Results qualified J+: 24 (13.4% of qualified, 0.48% of total)
- Results qualified UJ: 49 (27.4% of qualified, 0.97% of total)

These qualifications, once assigned, do not limit the use of the results for purposes of decision making. The *EPA Risk Assessment Guidance, Part A, Sec. 5.4.1, pg. 5-15 Data Usability* (EPA, 1989) states the following with respect to use of ‘J’ or ‘UJ’ qualified results:

*"The guidance here is to use J-qualified concentrations the same way as positive data that do not have this qualifier. If possible, note potential uncertainties associated with the qualifier, so that if data qualified with a J contribute significantly to the risk, the appropriate caveats can be attached."*

Results qualified as R are not enforcement or screening quality and should not be used to inform decisions. Zero results were qualified as R.

### **QA/QC Review of Inorganic Data**

Data validation summaries were completed using the data validation guidelines from *EPA National Functional Guidelines for Inorganic Data Review* (EPA, November 2020). The completed summaries are attached. Laboratory data flags and qualifiers are listed in **Tables 3, 4, 5 and 6**.

### **Field Data Quality**

A total of 109 data points (2.16% of total) were qualified as estimated due to field QA/QC deficiencies. Of these qualifications, 84 data points (77.1% of qualified, 1.7% of total) were due to hold time exceedances, 15 data points (13.8% of qualified, 0.30% of total) were due to field blank contamination, and 10 data points (9.17% of qualified, 0.20% of total) were due to field duplicate relative percent difference (RPD) exceeding the 20% aqueous criteria specified by the EPA and project QAPP.

### **Preservation and Hold Times**

Preservation includes proper field filtration, preservation, and acceptable pH and temperature upon receipt by the laboratory. Hold time is determined from the date of collection to the date of analysis. Laboratory pH hold time is 15 minutes, which is impossible to meet, so all analytical pH results were qualified as estimated; refer to field pH for accurate results. These accounted for all 84 qualified data points.

## Blanks

Equipment blank results are used to provide a measure of effectiveness of field decontamination procedures between sampling wells. Three equipment blank samples were collected during this sampling effort. There were seven analyte detections: Conductivity in all three plus DOC and chloride in equipment blank 2 and copper and manganese in equipment blank 4. Thirteen data points were qualified as estimated high (J+): Conductivity in field blanks 2 and 4, DOC in GS-29SR, BPS11-11A1, DUP-2, PMP-09A, PMP-08A2, and PMP-10A, and chloride in AMW-13B, BPS11-11A2, AMW-13B2, AMW-13C, and BPS11-11C. No other results were affected.

Field blank results are used to provide a measure of contamination during field sampling and sample processing. Five field blank samples were collected during this sampling effort. Field blanks 2 and 4 had detections for conductivity. Two data points (conductivity in field blanks 2 and 4) were qualified as estimated high (J+). No other results were affected.

## Duplicates

Field duplicate samples assess the variance of the field sampling methods. Duplicates were collected at a minimum frequency of 1 per 20 primary samples, meeting the project QAPP specified frequency, resulting in five field duplicate sample pairs. Six analytes exhibited relative percent differences (RPDs) above the 20% criteria, although only one analyte required qualification. A total of 10 aluminum data points were qualified as estimated (J or UJ). A summary of the RPD results is provided in **Table 6**.

## **Laboratory Data Quality**

A total of 70 data points (1.39%) were qualified as estimated due to laboratory QA/QC deficiencies. Of these qualifications, three data points (4.29% of qualified, <0.01% of total) were due to field blank contamination, 19 data points (27.1% of qualified, 0.38% of total) were due to poor laboratory precision, and 48 data points (68.6% of qualified, 0.95% of total) were due to due to poor laboratory accuracy.

### Laboratory Blank Results

Laboratory method blanks assess contamination introduced during sample laboratory preparation activities. There were 11 method blank detections, resulting in three data points qualified as estimated high (J+): TOC in AMW-09 and GS-40R and DOC in GS-28B.

### Laboratory Precision

Laboratory duplicate samples assess the variance of the analytical methods. There was one matrix spike duplicate RPD exceedance, resulting in 19 selenium data points qualified as estimated (J or UJ).

### Accuracy

Laboratory accuracy is measured with percent recoveries for calibration verifications, laboratory fortified blanks or control samples, and matrix spikes. There were 10 matrix spike recovery failures, resulting in eight bromide, 21 nitrate+nitrite, one TOC, and 18 silver data points qualified as estimated (J+, J-, or UJ).

**Completeness**

Out of 84 planned samples (71 natural, 13 QA/QC), all 84 samples were collected, resulting in a 100% complete sample delivery group. Out of 840 analyses planned, 838 analyses were completed, resulting in 99.8% complete work orders. Out of 5,052 data points, all 5,052 data points are usable, resulting in a 100% complete data package. The project QAPP data quality objectives (DQOs) have been met.

QUALIFIER DEFINITIONS	
<b>U</b>	The analyte was analyzed for but was not detected above the level of the adjusted detection limit or quantitation limit, as appropriate.
<b>UJ</b>	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
<b>J</b>	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
<b>J-</b>	The result is an estimated quantity, but the result may be biased low.
<b>J+</b>	The result is an estimated quantity, but the result may be biased high.
<b>R</b>	The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

**OVERALL SUMMARY****Data Quality**

Out of 5052 total data points:

- 4873 data points (96.5%) remain unqualified and are considered quantitative.
- Out of 179 data points (3.5%) qualified as estimated and assigned as qualitative:
  - 109 data points (60.9% of qualified, 2.2% of total) were due to field QA/QC.
  - 70 data points (39.1% of qualified, 1.4% of total) were due to laboratory QA/QC.
- No data points were rejected.

**Completeness**

Out of 84 samples planned (71 natural, 13 QA/QC), 84 (71 natural, 13 QA/QC) samples were completed. This SDG is 100% complete.

Out of 840 analyses planned, 838 analyses were completed. These WOs are 99.8% complete.

Out of 5052 data points produced, 5052 data points are useable. This data package is 100% complete.

### **Data Quality Executive Summary**

A total of 65 of the 66 total groundwater samples and all five surface water samples, as well as five field duplicates, three equipment blanks, and five field blanks were collected as part of Parrot Tailings Removal Performance Monitoring project. A total of 4,996 individual data points were produced, and 100% of these data points may be used to support decision-making for the risk assessment, developing site-specific risk-based clean up goals, and support an evaluation of the scope of remedial action (if necessary).

Due to a laboratory error, anion/cation balance was not analyzed for two samples. Out of 830 analyses planned (83 samples multiplied by 10 methods), 828 analyses (99.8%) were completed.

A total of 220 data points (4.40%) received qualification during validation due to results outside of QA/QC acceptance criteria, as defined in the *EPA National Functional Guidelines for Inorganic Data Review* (EPA, November 2020). These qualifications (J, J-, J+ , and UJ) indicate some uncertainty in reported results due to preservation, contamination, accuracy, and/or

precision issues. The following provides a summary of qualified results suitable for use in further decision making regarding the NRD Parrot Tailings.

- Results qualified J: 112 (50.9% of qualified, 2.24% of total)
- Results qualified J-: 16 (7.27% of qualified, 0.32% of total)
- Results qualified J+: 63 (28.6% of qualified, 1.26% of total)
- Results qualified UJ: 29 (13.2% of qualified, 0.58% of total)

These qualifications, once assigned, do not limit the use of the results for purposes of decision making. The *EPA Risk Assessment Guidance, Part A, Sec. 5.4.1, pg. 5-15 Data Usability* (EPA, 1989) states the following with respect to use of 'J' or 'UJ' qualified results:

*"Basically, the guidance here is to use J-qualified concentrations the same way as positive data that do not have this qualifier. If possible, note potential uncertainties associated with the qualifier, so that if data qualified with a J contribute significantly to the risk, the appropriate caveats can be attached."*

Results qualified as R are not enforcement or screening quality and should not be used to inform decisions. Zero results were qualified as R.

### **QA/QC Review of Inorganic Data**

Data validation summaries were completed using the data validation guidelines from *EPA National Functional Guidelines for Inorganic Data Review* (EPA, November 2020). The completed summaries are attached. Laboratory data flags and qualifiers are listed in **Tables 3, 4, 5 and 6**.

### **Field Data Quality**

A total of 163 data points (3.26% of total) were qualified as estimated due to field QA/QC deficiencies. Of these qualifications, 83 data points (50.9% of qualified, 1.66% of total) were due to hold time exceedances, 39 data points (23.9% of qualified, 0.78% of total) were due to field blank contamination, and 41 data points (25.2% of qualified, 0.82% of total) were due to field duplicate relative percent difference (RPD) exceeding the 20% aqueous criteria specified by the EPA and project QAPP.

### **Preservation and Hold Times**

Preservation includes proper field filtration, preservation, and acceptable pH and temperature upon receipt by the laboratory. Hold time is determined from the date of collection to the date of analysis. Laboratory pH hold time is 15 minutes, which is impossible to meet, so all analytical pH results were qualified as estimated; refer to field pH for accurate results. These accounted for all 83 qualified data points.

### **Blanks**

Equipment blank results are used to provide a measure of effectiveness of field decontamination procedures between sampling wells. Three equipment blank samples were collected during this sampling effort. There were 12 analyte detections: Conductivity in all three plus DOC, TOC,

cadmium, and chloride in equipment blank 2, manganese in equipment blank 3, and cadmium, copper, manganese, and zinc in equipment blank 4. A total of 30 data points were qualified as estimated high (J+):

- cadmium in BPS11-10A, BPS11-11A2, PMP-10A, and BPS11-14A
- chloride in BPS11-10B, BPS11-10C, AMC-24C, BPS11-11A1, BPS11-11A2, BPS11-11B, DUP-2, and BPS11-11C
- conductivity in BPS11-11A2
- copper and zinc in BPS11-14A
- manganese in GS-29SR,R PMP-08B, BPS11-17C, PMP-10B, PMP-10A, BPS11-14A, and BPS11-14B
- DOC in MF-07, MF-07B, PMP-06A, PMP-06B, BPS07-11A, BPS11-11A1, BPS07-11B, and PMP-01B

No other results were affected.

Field blank results are used to provide a measure of contamination during field sampling and sample processing. Five field blank samples were collected during this sampling effort. Field blank 1 had detections for conductivity, copper, and nitrate+nitrite. Nine data points were qualified as estimated high (J+): copper in PMP-11B, AMWW-13A, PMP-09B, AMC-23B, PMP-08A, and PMP-07B and nitrate+nitrite in BPS07-07, PMP-02B, and PMP-07B. No other results were affected.

### Duplicates

Field duplicate samples assess the variance of the field sampling methods. Duplicates were collected at a minimum frequency of 1 per 20 primary samples, meeting the project QAPP specified frequency, resulting in five field duplicate sample pairs. Seven analytes exhibited relative percent differences (RPDs) above the 20% criteria, four of which required qualification. A total seven of copper, iron, and manganese and 20 TOC data points were qualified as estimated (J or UJ). A summary of the RPD results is provided in **Table 6**.

### **Laboratory Data Quality**

A total of 64 data points (1.28% of total) were qualified as estimated due to laboratory QA/QC deficiencies. Of these qualifications, 10 data points (15.6% of qualified, 0.20% of total) were due to field blank contamination and 54 data points (84.4% of qualified, 1.08% of total) were due to due to poor laboratory accuracy.

### Laboratory Blank Results

Laboratory method blanks assess contamination introduced during sample laboratory preparation activities. There were 41 method blank detections, resulting in only 10 data points qualified as estimated high (J+): TOC in PMP-04B, AMW-01C, PMP-02B, AMW-20, PMP-07B, MSD-02A, AMW-01B, and DUP-4, zinc in EB-4, and alkalinity in MH-MSD113.

### Laboratory Precision

Laboratory duplicate samples assess the variance of the analytical methods. All laboratory duplicate RPDs were below criteria maximums; therefore, no qualification was required.

### Accuracy

Laboratory accuracy is measured with percent recoveries for calibration verifications, laboratory fortified blanks or control samples, and matrix spikes. There were two continuing calibration verifications, one laboratory fortified blank, and eight matrix spike recovery failures. As a result, 13 bromide, 11 nitrate+nitrite, 14 TOC, and 16 sulfate data points were qualified as estimated (J, J+, J-, or UJ) only due to one or more matrix spike recoveries outside of acceptance criteria limits.

### **Completeness**

Out of 84 planned samples (71 natural, 13 QA/QC), 83 samples were collected (70 natural, 13 QA/QC), resulting in a 98.8% complete sample delivery group. Out of 830 analyses planned, 828 analyses were completed, resulting in 99.8% complete work orders. Out of 4,996 data points, all 4,996 data points are usable, resulting in a 100% complete data package. The project QAPP data quality objectives (DQOs) have been met.

### QUALIFIER DEFINITIONS

<b>U</b>	The analyte was analyzed for but was not detected above the level of the adjusted detection limit or quantitation limit, as appropriate.
<b>UJ</b>	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
<b>J</b>	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
<b>J-</b>	The result is an estimated quantity, but the result may be biased low.
<b>J+</b>	The result is an estimated quantity, but the result may be biased high.
<b>R</b>	The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

BPS07-23 (original) & DUP-1 (duplicate): representing all low-flow samples (BPS07-07B, BPS07-07, BPS07-23, DUP-1, PMP-11B, AMW-13A, GS-28B, PMP-09B, GS-28, FB-1, AMC-23B, PMP-08A, PMP-04B, PMP-01A, AMC-24B, PMP-02B, PMP-07B, MSD-02A, PMP-02A, AMW-01A) ❖ TOC RPD was 126%, >20% CL. The original and duplicate sample results were <5xRL. The absolute difference between the original and duplicate sample results was >RL. ➢ BPS07-07B, PMP-11B, GS-28B, FB-1, AMC-23B, and AMC-24B were qualified as estimated ND (UJ). ➢ All remaining samples were qualified as estimated detections (J). ▪ PMP-04B, PMP-02B, PMP-07B, and MSD-02A were more specifically qualified as estimated high (J+) due to MB contamination. AMW-01B (original) & DUP-4 (duplicate): representing GS-40R, PMP-10B, AMW-09, PMP-10A, BPS11-14A, BPS11-14B, AMW-08, AMW-01C, AMW-20, FB-4, AMW-01B, DUP-4, EB-4, PMP-03A ❖ DOC and TOC RPDs were 25.0% and 40.0%, respectively, >20% CL. The original and duplicate sample results were <5xRL. The absolute difference between the original and duplicate sample results was ≤RL. ➢ No qualification required. ❖ Selenium: The original sample result was detected (<5xRL) while the duplicate sample result was ND and replaced with 0.0005 mg/L (half RL) to give a 66.7% RPD, >20% CL. The absolute difference between the detected original sample result and half RL (ND duplicate sample result) was ≤RL. ➢ No qualification required SS-04 (original) & DUP-5 (duplicate): representing all SW samples except MH-MSD sites (SS-04, DUP-5, FB-5, PMP-12, MSDSG-02, MSDSG-05, MSDSG-03). The MH-MSD sites are split samples collected from another consultant and are not subject to QA/QC under this SDG. ❖ Dissolved Copper RPD was 54.5%, >20% CL. The original and duplicate sample results were <5xRL. The absolute difference between the original and duplicate sample results was >RL. ➢ PMP-12, SS-04, DUP-5, and MSDSG-05 were qualified as estimated detections (J). ➢ FB-5, MSDSG-02, and MSDSG-03 were qualified as estimated ND (UJ). ❖ Dissolved Iron RPD was 33.3%, >20% CL. The original and duplicate sample results were ≥5xRL. ➢ FB-5 was qualified as estimated ND (UJ). ➢ All remaining samples were qualified as estimated detections (J). ❖ Total Manganese RPD was 30.8%, >20% CL. The original and duplicate sample results were ≥5xRL. ➢ FB-5 was qualified as an estimated ND (UJ). ➢ All remaining samples were qualified as estimated detections (J).		X

      - ◆ No qualification was required for any samples due to all results  $\geq 10 \times \text{MB}$ .
- Batch R187919
  - Manganese was detected at 0.00006 mg/L, <RL of 0.001 mg/L.
    - Batch samples include: DUP-5, FB-5, MSDSD-02, MSDSG-05, MSDSG-03
      - ◆ FB-5 did not require qualification due to a ND result.
      - ◆ All remaining samples did not require qualification due to results  $\geq 10 \times \text{MB}$ .
  - Zinc was detected at 0.001 mg/L, <RL of 0.008 mg/L.
    - Batch samples include: GS-28, EB-4, SS-04, DUP-5, FB-5, MSDSD-02, MSDSG-05, MSDSG-03
      - ◆ EB-4 was qualified as estimated high (J+) due to a result  $\geq \text{RL}$  but  $< 10 \times \text{MB}$ .
      - ◆ MSDSG-05 and MSDSG-03 did not require qualification due to results  $\geq 10 \times \text{MB}$ .
      - ◆ All remaining samples did not require qualification due to ND results.
- Batch R189087: all three MH-MSD sites (MH-MSD108, MH-MSD113, MH-MSD116)
  - Thorium was detected at 0.000008 mg/L, <RL of 0.005 mg/L.
    - No qualification was required for any samples due to all ND results.

## OVERALL SUMMARY

### Data Quality

- Out of 4996 total data points:
- 4776 data points (95.6%) remain unqualified and are considered quantitative.
  - Out of 220 data points (4.4%) qualified as estimated and assigned as qualitative:
    - 163 data points (74.1% of qualified, 3.3% of total) were due to field QA/QC.
    - 64 data points (29.1% of qualified, 1.3% of total) were due to laboratory QA/QC.
  - No data points were rejected.

### Completeness

Out of 84 samples planned (71 natural, 13 QA/QC), 83 (70 natural, 13 QA/QC) samples were completed. This SDG is 98.8% complete.  
Out of 830 analyses planned, 828 analyses were completed. These WOs are 99.8% complete.

Out of 4996 data points produced, 4996 data points are useable. This data package is 100% complete.

### **Data Quality Executive Summary**

All 66 groundwater samples and all five surface water samples, as well as five field duplicates, three equipment blanks, and five field blanks were collected as part of Parrot Tailings Removal Performance Monitoring project. A total of 5,054 individual data points were produced, and 100% of these data points may be used to support decision-making for the risk assessment, developing site-specific risk-based clean up goals, and support an evaluation of the scope of remedial action (if necessary).

A total of 361 data points (7.14%) received qualification during validation due to results outside of QA/QC acceptance criteria, as defined in the *EPA National Functional Guidelines for Inorganic Data Review* (EPA, November 2020). These qualifications (J, J-, J+ , and UJ) indicate some uncertainty in reported results due to preservation, contamination, accuracy, and/or precision issues. The following provides a summary of qualified results suitable for use in further decision making regarding the NRD Parrot Tailings.

- Results qualified J: 115 (31.9% of qualified, 2.28% of total)
- Results qualified J-: 61 (16.9% of qualified, 1.21% of total)

- Results qualified J+: 136 (37.7% of qualified, 2.69% of total)
- Results qualified UJ: 49 (13.6% of qualified, 0.97% of total)

These qualifications, once assigned, do not limit the use of the results for purposes of decision making. The *EPA Risk Assessment Guidance, Part A, Sec. 5.4.1, pg. 5-15 Data Usability* (EPA, 1989) states the following with respect to use of ‘J’ or ‘UJ’ qualified results:

*"Basically, the guidance here is to use J-qualified concentrations the same way as positive data that do not have this qualifier. If possible, note potential uncertainties associated with the qualifier, so that if data qualified with a J contribute significantly to the risk, the appropriate caveats can be attached."*

Results qualified as R are not enforcement or screening quality and should not be used to inform decisions. One result (carbonate in AMW-13B) was qualified as R due to the laboratory’s failure to analyze within technical hold time and a non-detect result.

### **QA/QC Review of Inorganic Data**

Data validation summaries were completed using the data validation guidelines from *EPA National Functional Guidelines for Inorganic Data Review* (EPA, November 2020). The completed summaries are attached. Laboratory data flags and qualifiers are listed in **Tables 3, 4, 5 and 6**.

### **Field Data Quality**

A total of 259 data points (5.12% of total) were qualified as estimated due to field QA/QC deficiencies. Of these qualifications, 84 data points (32.4% of qualified, 1.66% of total) were due to hold time exceedances, 135 data points (52.1% of qualified, 2.67% of total) were due to field blank contamination, and 50 data points (19.3% of qualified, 0.99% of total) were due to field duplicate relative percent difference (RPD) exceeding the 20% aqueous criteria specified by the EPA and project QAPP.

### **Preservation and Hold Times**

Preservation includes proper field filtration, preservation, and acceptable pH and temperature upon receipt by the laboratory. Hold time is determined from the date of collection to the date of analysis. Laboratory pH hold time is 15 minutes, which is impossible to meet, so all analytical pH results were qualified as estimated; refer to field pH for accurate results. These accounted for all 84 qualified data points.

### **Blanks**

Equipment blank results are used to provide a measure of effectiveness of field decontamination procedures between sampling wells. Three equipment blank samples were collected during this sampling effort. There were 26 analyte detections resulting in estimated high (J+) qualifications for 11 analytes. No other results were affected.

Field blank results are used to provide a measure of contamination during field sampling and sample processing. Five field blank samples were collected during this sampling effort. There were no positive detections in any of the field blanks.

### Duplicates

Field duplicate samples assess the variance of the field sampling methods. Duplicates were collected at a minimum frequency of 1 per 20 primary samples, meeting the project QAPP specified frequency, resulting in five field duplicate sample pairs. Six analytes exhibited relative percent differences (RPDs) above the 20% criteria, two of which required qualification. A total of 20 copper and 20 manganese data points were qualified as estimated (J or UJ). A summary of the RPD results is provided in **Table 6**.

### **Laboratory Data Quality**

A total of 102 data points (2.02%) were qualified as estimated and one data point (<0.01%) was qualified as unusable due to laboratory QA/QC deficiencies. Of these qualifications, three estimated data points (2.94% of qualified, <0.01% of total) and one rejected data point (<0.01% of total) were due to analysis past hold time, one data point (0.98% of qualified, <0.01% of total) was due to field blank contamination, and 99 data points (97.1% of qualified, 1.96% of total) were due to poor laboratory accuracy.

### Analysis Hold Times

Hold time is determined from the date of collection to the date of analysis. Alkalinity and bicarbonate in AMW-13B and nitrate+nitrite in PMP-01A were qualified as estimated low (J-) due to analysis past hold time and detected results. Carbonate in AMW-13B was rejected (R) due to analysis past hold time and a non-detect result.

### Laboratory Blank Results

Laboratory method blanks assess contamination introduced during sample laboratory preparation activities. There were 60 method blank detections, resulting in only one data point (vanadium in MH-MSD116) qualified as estimated high (J+). No other results were affected.

### Laboratory Precision

Laboratory duplicate samples assess the variance of the analytical methods. All laboratory duplicate RPDs were below criteria maximums; therefore, no qualification was required.

### Accuracy

Laboratory accuracy is measured with percent recoveries for calibration verifications, laboratory fortified blanks or control samples, and matrix spikes. There were 10 matrix spike recovery failures, resulting in 30 bromide, 13 calcium, and 52 nitrate+nitrite data points qualified as estimated (J, J+, J-, or UJ).

### **Completeness**

Out of 84 planned samples (71 natural, 13 QA/QC), all 84 samples were collected, resulting in a 100% complete sample delivery group. Out of 840 analyses planned (84 samples multiplied by 10 methods), all 840 analyses were completed, resulting in 100% complete work orders. Out of

5,054 data points, all 5,054 data points are usable, resulting in a 100% complete data package. The project QAPP data quality objectives (DQOs) have been met.

### QUALIFIER DEFINITIONS

<b>U</b>	The analyte was analyzed for but was not detected above the level of the adjusted detection limit or quantitation limit, as appropriate.
<b>UJ</b>	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
<b>J</b>	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
<b>J-</b>	The result is an estimated quantity, but the result may be biased low.
<b>J+</b>	The result is an estimated quantity, but the result may be biased high.
<b>R</b>	The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

**Level A/B Assessment Checklist**  
**Fourth Quarter of 2023**

**I. General Information**

**Site:** Parrot  
**Project:** Parrot Performance Monitoring  
**Client:** NRD  
**Sample Matrix:** Aqueous  
**Lab Report #s:** H23110570, H23110571, H23110658, H23110659

**II. Enforcement Results**

Data are:  
 1) Unusable   
 2) Level A   
 3) Level B

**III. Level A Screening**

Criteria – The following must be fully documented:	Yes/No	Comments
1. Sampling date	Yes	
2. Sampling team or leader	Yes	
3. Physical description of sampling location	Yes	
4. Sample depth (soils)	N/A	
5. Sample collection technique	Yes	
6. Field preparation technique	N/A	
7. Sample preservation technique	Yes	
8. Sample shipping records and laboratory analysis dates	Yes	
9. Companion sampling efforts	Yes	
10. Visual classification of samples	NA	Aqueous Samples

**IV. Level B Screening**

Criteria – The following must be fully documented:	Yes/No	Comments
1. Field/laboratory instrumentation, standardization and methods/procedures	Yes	
2. Proper sample containers and container preparation	Yes	
3. Collection of field replicates (1/20 minimum)	Yes	
4. Proper and decontaminated sampling equipment	N/A	
5. Identity of sample taker	Yes	
6. Field custody documentation	Yes	
7. Shipping custody documentation	Yes	
8. Traceable sample designation number	Yes	
9. Field notebooks, custody records in secure repository	Yes	
10. Properly prepared and complete field forms	Yes	
11. Physical data/observations date and time	Yes	
12. Physical data/observations recorder, team leader	Yes	
13. Physical data/observation location	Yes

**COMMENTS/OBSERVATIONS**

Water level drew down to top of pump within 3 min. Flow fluctuated due to drawdown and recovery. Did not have the one working flow controller. Suggest a flow controller at 1 gpm.

**COMMENTS/OBSERVATIONS**

Well purged, stabilized prior to sample and sampled @ 1319. Before survey could be sent Survey123 crashed and the field form got deleted. Collecting parameters until stable again.

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

The reference date for Radon analysis is the sample collection date. The reference date for all other Radiochemical analyses is the analysis date. Radiochemical precision results represent a 2-sigma Total Measurement Uncertainty.

## Contact and Corrective Action Comments:

The temperature of the sample(s) for shipping container 1 was 1.5°C, shipping container 2 was 0.0°C, shipping container 3 was 0.8°C, shipping container 4 was 2.9°C, shipping container 5 was 0.7°C, shipping container 6 was 0.3°C and shipping container 7 was 0.2°C.

Samples MH-MSD108, MH-MSD113 and MH-MSD116 no time on COC, used time from sample containers.

Sample BPS11-10B metals container is marked as unfiltered. Client contacted. wjj 1/20/2023

## Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

The reference date for Radon analysis is the sample collection date. The reference date for all other Radiochemical analyses is the analysis date. Radiochemical precision results represent a 2-sigma Total Measurement Uncertainty.
